

ImagePlus Connector for IICE

WebSphere Information Integrator Content Edition

Power and Flexibility

Organizations that use ImagePlus have long desired a tool that will allow them federated access to their content in a thin-client application. SYSCOM is proud to announce their new ImagePlus Connector for IICE. Now, in one easy to use browser window, workers can access content from all repositories, and leverage features such as Wildcard and Compound Search, Federated Search, Secondary Index Search, and Document Copy between repositories.

All FAF, FWA, and AIS+ features... in a browser!

Wildcard/Compound Search

For the first time in a thin-client browser connection to ImagePlus, workers can use a Wildcard Search, requiring only part of a name to complete the search. Compound Search allows users to employ Boolean operators (Like, Not Like, etc.) in their searches.

Federated Search

IICE renders all connected repositories as a single system. Enter search terms in one screen, and IICE will find matching documents in any connected Library.

**All your content. From any repository.
In a browser... Finally.**

Secondary Index Search

Another first for a thin-client, IICE with the ImagePlus Connector allows users to search on Secondary Index fields, providing increased efficiency for greater effectiveness.

Document Copy

The ImagePlus Connector for IICE provides users with the ability to copy documents from their ImagePlus repository to any other connected Library, and vice versa.
